1. Introduction

1.1 Domain Description

The domain of the SmartCare Management System (SmartCare) focuses on home care services specifically designed for elderly individuals, children, or patients requiring domestic assistance. It caters to caretaker companies offering services such as elder care, babysitting, and maid services.

The system functions as a digital platform connecting clients (elders or families) with professional caretakers while also streamlining administrative processes for the company. It bridges the communication gap between clients and caretakers, ensuring efficient scheduling, service assignment, and management.

1.2 Current System and Limitations

At present, many caretaker companies depend on manual processes, such as phone calls, paper-based records, and spreadsheets, for managing staff, client requests, schedules, and attendance. These manual operations introduce several limitations:

- Manual handling of tasks leads to human errors, delays, and miscommunication.
- Lack of centralized data storage hinders tracking and decision-making.
- Difficulty in managing caretaker assignments, leave approvals, complaints, and feedback collection.

Overall, the current system is time-consuming, error-prone, and lacks reliability.

1.3 Goal & Objectives

1.3.1 General Goal

To develop a centralized caretaker management platform that simplifies service assignment, role management, schedule tracking, leave handling, and profile maintenance enhancing the overall caregiving experience for both clients and companies.

1.3.2 Specific Objectives

1. Implement Role-Based Login System

Develop a secure login and access control system for multiple user roles: Admin, HR Manager, Caretaker, Maid, Babysitter, and Client. Each role will access a personalized dashboard with role-specific features.

2. Caretaker Profile Management

Enable caretakers to view and update their personal and professional profiles, including contact details, specialization, experience, and availability.

3. View Assigned Clients and Schedule

Provide caretakers with an organized view of their upcoming tasks, assigned clients, service type, and time slots for better planning and efficiency.

4. Leave Request and Approval System

Allow caretakers to request leave by submitting dates and reasons. HR managers can approve or reject leave requests based on caretaker availability and schedule conflicts.

5. Client Registration and Service Booking

Allow clients to register, log in, and request services like elder care, babysitting, or housekeeping based on preferred date, time, and caretaker type.

6. Caretaker Assignment

Enable the HR/Admin to assign caretakers either manually or automatically based on availability, client preferences, and geographic proximity.

7. Customized Caretaker Schedule Creation

Allow HR managers to manually create or adjust individual caretaker schedules (e.g. fixed clients on specific days or shifts), overriding automatic allocations if needed.

8. Location-Based Filtering

Match clients with nearby caretakers to optimize travel time and ensure timely service. This helps in balancing assignments across caretakers.

9. Service History Tracking

Maintain detailed logs of each caretaker's service history, including date, service type, client, and feedback received.

10. Complaint Management System

Allow clients to file complaints against services or caretakers. HR/Admin can view, track, and resolve these complaints, maintaining transparent logs for quality assurance.

11. Reporting and Analytics for Admin

Generate monthly or custom reports including service volume, caretaker utilization, leave reports, complaint statistics, and client feedback summaries.

12. Client Feedback System

Collect structured feedback from clients after each service, which helps improve caretaker performance and service quality monitoring.

13. Notifications and Reminders

Send automatic alerts to caretakers and clients regarding upcoming service appointments, leave decisions, or schedule changes.

14. Service Status Updates

Allow caretakers to mark services as completed, and allow clients to confirm or rate the completed service for accountability and transparency.

15. Security and Access Control

Protect all user data using encrypted passwords, session-based login handling, and strict access based on user roles.

1.4 Assumptions

- The caretaker company has stable internet and basic IT infrastructure.
- End users possess basic digital literacy.
- The service types remain fixed and predefined.
- All feedback and complaints are submitted in good faith.
- HR and Admin staff are trained to use the platform.
- There are no legal barriers to storing basic user data.
- The system will be developed using standard web technologies (PHP, MySQL, HTML, CSS, JS).
- Each user accesses the system through one device/session at a time.
- The project has sufficient resources and time to complete development.

2. Feasibility Study

2.1 Technical Feasibility

Category	Technology / Tool	Short Description
Frontend	HTML	Structures the web pages and content.
	CSS	Styles the layout and ensures responsive design.
	JavaScript	Adds interactivity and client-side logic.
Backend	PHP	Handles server-side logic like form processing, sessions, and validations.
	MySQL	Stores user data, schedules, payments, and history.
Web Server	Apache HTTP Server	Hosts the web application and supports PHP and MySQL integration.
Local Testing	XAMPP/ WAMP	Bundled tools for local development with Apache, PHP, and MySQL.
Version Control	Git	Tracks code changes, enables collaboration, and version management.
Code Repository	GitHub	Stores project code, supports collaboration and issue tracking.
Documentation	Google Docs	Used for writing reports, proposals, and shared team documents.
Project Management	Jira	Tracks tasks, sprints, and project progress.
Prototyping	Figma	Designs UI mockups and wireframes with real-time team collaboration.

2.2 Economic Feasibility

Economic feasibility examines whether the system's benefits justify its costs. SmartCare is expected to improve efficiency, reduce manual tasks, and offer long-term savings for the caretaker company.

2.2.1 Cost Analysis

- **Development Costs**

- **Labor:** No paid developers; student hours simulate real-world effort.
- **Software Tools:** Free/open-source (VS Code, Git, Figma, MySQL, XAMPP).
- **Hardware:** Personal laptops and internet—no additional hardware needed.

- **Hosting & Deployment Costs**

- **Web Hosting:** Optional; LKR 5,000–10,000/year on platforms like Hostinger.
- **Domain Name:** Approx. LKR 2,000–3,000/year.
- **Local Deployment:** Free via XAMPP for academic/demo purposes.

- **Maintenance & Upgrades**

- Minimal costs; occasional bug fixes or feature updates may require developer effort.

- **Training & Support**

- No formal training cost; time allocated for user manuals and demos for Admin, HR, and Caretakers.

2.2.2 Benefit Analysis

- **Operational Efficiency:**

- Automates bookings, assignments, leave tracking—saving HR time and reducing paperwork.

- **Improved Accuracy:**

- Reduces scheduling and payroll errors through automation.

- **Better Service Quality:**

- Faster client responses and balanced workloads enhance client satisfaction.

- **Scalability:**

- System supports future growth (more users/services) at low additional cost.

- **Long-Term Savings:**

- Reduces reliance on physical records and manual coordination, cutting recurring costs.

2.3 Social Feasibility

Social feasibility evaluates whether the proposed SmartCare – Caretaker Management System will be accepted by its intended users, including caretakers, HR managers, administrators, and clients. It also considers the system's potential to positively impact users' daily activities and improve coordination in the caregiving process.

2.3.1. Assumptions and User Expectations

Although no formal surveys or interviews were conducted due to time and resource constraints, the system's requirements were identified through:

- Informal discussions with peers and individuals familiar with caretaker and service-based work environments.
- Observations of general industry challenges such as manual scheduling, inefficient leave handling, and lack of centralized tracking.
- Secondary research through online platforms and comparisons with existing service management tools.

From these sources, several user needs were identified:

- Caretakers require a system that shows their assignments and allows them to manage their leave and profile.
- Clients need transparency in who provides services and a way to view service history or give feedback.
- HR/Admin staff benefit from automation in assigning staff, managing leaves, and generating reports.

2.3.2 Anticipated Social Benefits

The SmartCare system is designed to address these concerns and offer social value across all stakeholder roles:

1. For Caretakers

- a. Ability to track schedules, apply for leave, and update their profiles with ease.
- b. Increased clarity around assignments and salary tracking.

2. For Clients

- a. Clear information about assigned caretakers and ability to review service history.
- b. Higher confidence in service reliability and quality.

3. For Admin/HR

- a. Streamlined workflow for managing staff schedules and leaves.
- b. Fewer manual errors and reduced paperwork.

2.3.3 User Interface Accessibility

One of the core goals of the system is inclusivity and ease of use. The SmartCare platform features a **simple and intuitive user interface** designed for users with **varying levels of digital literacy**. Icons, clear navigation menus, and clean page layouts ensure that caretakers, even with limited technical knowledge, can easily learn and use the system. This greatly increases the likelihood of system acceptance and long-term usage across all user groups.

2.4 Operational Feasibility

Operational feasibility checks if the SmartCare system can be effectively used and sustained in real caretaker company environments.

2.4.1 Integration with Existing Operations

- Designed to replace manual methods with digital workflows.
- Automates caretaker assignments, leave tracking, and schedules.
- Eases HR workload and improves coordination and record-keeping.

2.4.2 User Adaptability and Training

- Simple interface with clear navigation and role-specific dashboards.
- Minimal training needed; user guides or demo videos can assist.
- **Caretakers:** View schedules, apply for leave, track work.
- **HR/Admins:** Assign staff, manage users, generate reports.
- **Clients:** Request services, view history, give feedback.

2.4.3 Maintenance and Support

- Built using common tools (PHP, MySQL) and easy to maintain.
- Companies can use internal IT or third-party help for:
Backups, security, feature updates, scaling.
- Future support may include bug fixes, UI upgrades, and new features.

2.4.4 Scalability and Long-Term Use

- Easily adaptable to new caretaker roles or services.
- Can scale to more users, locations, and features as the business grows.
- Enables advanced reporting as data increases over time.

2.5 Legal and Ethical Feasibility

2.5.1 Legal Feasibility

Legal feasibility assesses whether there are any **laws, regulations, or policies** that could affect the development, deployment, or use of the SmartCare system.

1. Data Protection and Privacy

SmartCare will store sensitive data, including:

- Caretaker details (name, contact, availability, etc.)
- Client information (addresses, service needs)
- Salary and service history records

Although this project is for academic purposes, in a real-world deployment, it must comply with:

- **Personal Data Protection Act (Sri Lanka)** – if applicable
- **General principles of privacy laws** such as:
 - Not collecting more data than necessary
 - Storing data securely
 - Limiting data access based on user roles
 - Not sharing personal data without consent

2. Compliance with IT Regulations

- The system will not involve illegal content, third-party copyright violations, or harmful features.
- The technologies used (PHP, MySQL, GitHub, etc.) are all open-source or licensed for educational and commercial use.

2.5.2 Ethical Feasibility

Ethical feasibility focuses on ensuring that the system is designed and used in a morally responsible way and promotes fair treatment, transparency, and trust among its users.

1. User Consent and Transparency Our team consists of **four members**, each with prior experience in web development, UI/UX design, and system architecture. This collective skill set enables the team to manage the project's complexity efficiently while maintaining development quality.

- Only authorized users (based on roles) can access specific parts of the system.
- Users are aware of what information is stored and how it will be used.
- Clients and caretakers will have access to their own data.

2. Fairness and Equal Access

- No user is given unfair advantage; all roles have clearly defined permissions.
- The system does not discriminate based on gender, religion, or age.

3.Data Accuracy and Responsibility

- Admins and HR managers are expected to update and verify information correctly.
- The system promotes accountability (e.g., through service history tracking and feedback).

4.Digital Literacy Consideration

- The system is designed with a simple and accessible interface to ensure that even users with basic digital skills can use it effectively.

5.6 Schedule Feasibility

The SmartCare – Caretaker Management System is planned with a strong emphasis on schedule feasibility. Our team is utilizing the iterative development model, as the core requirements are well-defined but the model allows flexibility to revise and enhance features as feedback is received during development. This approach ensures continuous improvement without derailing the project timeline.

The total duration allocated for the project is nine months, with eight months dedicated to core development activities and one month allocated for testing, documentation, and final adjustments. This timeline is realistic and allows adequate time for planning, design, implementation, testing, and refinements.

Considering these factors, we can confidently conclude that the schedule feasibility of the SmartCare project is high. With a structured approach, dedicated team members, and an iterative model, the project is on track to meet its completion deadline without compromising quality.

2.6.1 Man-Hour Calculation

- **Estimated working time per member per week** = 10 hours
- **Estimated duration** = 40 weeks
- **Total hours per member** = 10 hours $\times$ 40 weeks = 400 hours
- **Team size** = 4 members
- **Estimated total man-hours for the project** = 400 hours $\times$ 4 members = 1600 hours

This allocation ensures enough time is available for requirements gathering, UI/UX design, frontend and backend development, integration, testing, and documentation. It also accommodates minor delays or scope adjustments within the project timeline.

3. Requirements

3.1 Stakeholders / Actors

- **Admin (Caretaker Company):** Oversees system, manages users, generates reports.
- **HR Manager:** Handles caretaker schedules, leave approvals, assignments, performance
- **Caretaker (Elder Caretakers / Maids / Babysitters):** Views profiles, schedules, applies for leave, marks attendance.
- **Client (Elder or Family):** Registers, books services, provides feedback, manages payments.

3.2 Functional Requirements

3.2.1 Admin (Caretaker Company)

- Login
- View dashboard with stats on clients, caretakers, bookings, and service usage
- Manage Users (HR Manager, Caretakers and Clients)
- View all users with filters by role or service type
- Manage client feedback and flag inappropriate reviews
- View and export reports (usage, payments, performance)
- View caretaker leave records
- Monitor full history logs and user activity
- Send system-wide announcements or notifications
- View payment reports and financial summaries

3.2.2 HR Manager

- Login
- Manage caretaker work schedules
- Approve or decline caretaker leave requests
- Assign caretakers to client requests/services
- Track caretaker attendance and availability
- View caretaker performance based on client feedback
- View service history for each caretaker
- Generate reports on caretaker activities and services
- Assign or remove high-priority status to caretakers
- Adds or update caretaker working locations (city/district/postal code)
- Approve or reject client service requests
- Handle complaints related to caretakers or services

3.2.3 Caretaker (Elder caretakers / Maids / Babysitters)

- SignUp
- Login
- View and update personal profile details
- View assigned client list and daily/weekly work schedule
- Apply for leave with reason and preferred dates
- View leave request status and complete leave history
- View feedback and ratings received from clients
- Access service history (past appointments, hours worked, service types)
- Mark attendance/check-in and check-out for client visits
- View personal priority status and badge
- Receive priority or special bookings based on status/performance
- Get notifications for new request, updates or changes in schedule
- Accept or reject assigned service requests within allowed time frame
- Report issues or complaints related to clients or service tasks

3.2.4 Client (Elder or Family)

- SignUp
- Login
- View available caretakers with profile information, ratings & comments, real-time service availability
- Book services by selecting caretaker, preferred date and time
- Make an advance payment when requesting a caretaker service
- Remaining balance is paid after the service is completed
- Give feedback & rating after service
- Complaining about caretakers
- View booking history and service details
- View payment history
- Cancel or reschedule contract
- Contact the assigned caretaker
- Change assigned caretaker if not satisfied
- Create customized service plans for caretakers
- Filter caretakers by location

3.3 Non-Functional Requirements

8.2.1. Reliability

The SmartCare system should be highly reliable to ensure continuous service availability for clients, caretakers, and HR managers. It must:

- Function correctly under normal conditions without frequent crashes or data loss.
- Handle failures gracefully, e.g., temporary database issues should not cause the whole system to fail.
- Ensure that caretaker schedules, leave records, and complaints are not lost or corrupted.

8.2.2. Performance

The system must deliver a smooth and responsive experience across all modules. Specifically:

- Pages should load within 2–3 seconds on average.
- Searching caretakers or generating reports must respond quickly, even with moderate amounts of data.
- Simultaneous users (e.g., multiple clients submitting service requests or complaints) should not cause lag.

8.2.3. Scalability

While initially designed for a single caretaker company, the system must be scalable enough to support:

- Increased number of users (e.g., more clients or caretakers in the future).
- Additional service types (e.g., if new services like pet care or nursing are added later).
- Expansion to support more detailed modules such as finance or performance analytics.

8.2.4. Security

As the system handles personal information (user details, schedules, complaints), it must be secure. This includes:

- Role-based access control (Admin, HR, Caretaker, Client).
- Secure login with encrypted passwords and reset options.
- Prevent unauthorized access to sensitive data like salaries and internal reports.
- Sanitize user inputs to protect against SQL injection or XSS attacks.

8.2.5. Maintainability

The system should be easy to maintain and update. This is ensured by:

- Writing clean, modular code using standard web technologies (HTML, CSS, JS, PHP).
- Maintaining good documentation for future developers.
- Using Git for version control to track changes and manage updates.
- Structuring the backend so that service types, roles, and reports can be extended or modified with minimal changes.

8.2.6 Usability

The user interface should be simple, intuitive, and accessible for all user types, including:

- Clients with little technical knowledge (elderly or non-digital-savvy users).
- Caretakers accessing their schedules or submitting leave.
- HR and Admin users needing quick access to reports and management functions.
- Responsive design so it works on desktops, tablets, and mobile browsers.

3.4 Scope of the project

3.2.1 In-Scope

The SmartCare system will include the following core functionalities:

- **User Management:**
 - Admin can register HR Managers and Caretakers.
 - Clients can self-register via the system.
- **Caretaker Scheduling:**
 - HR can assign caretakers to clients based on service needs and availability.
 - System generates customized caretaker schedules.
- **Leave Management:**
 - Caretakers can apply for leave.
 - HR/Admin can approve or reject leave requests.
- **Complaint Management:**
 - Clients can submit complaints.
 - HR can view, respond to, or escalate complaints.
- **Feedback System:**
 - Clients can provide service feedback for caretakers.
- **Service Management:**
 - Admin can define and manage different care services (e.g., elder care, cleaning, babysitting).
- **Reports & Dashboards:**
 - Admin and HR can view system-generated reports (attendance, feedback, salary logs, etc.).
- **Login and Authentication:**
 - Role-based secure login for Admin, HR, Caretakers, and Clients.
 - Forgot/Reset password feature.
- **Basic UI/UX:**
 - Simple and user-friendly interface accessible by all types of users.
- **Payment Mechanism:**
 - Clients can make online payments for services through secure payment gateways.
 - The system records payments and tracks their status.

3.2.2 Out-Scope

The following functionalities are intentionally excluded from this version of the system:

- Live chat or video calling features.
- Mobile app version (web only for now).
- Integration with third-party tools like payroll or HRMS systems.
- Multi-company support — the system is built for one caretaker company only.
- Managing school or property caretakers (only elder care, babysitting, and maid services are supported).

3.5 Constraints and Limitations

Constraints:

- Limited to a 9-month development period by a team of 4 members.
- The development environment is constrained to the following technologies:
 - Frontend: HTML, CSS, JavaScript
 - Backend: PHP
 - Database: MySQL
 - Web Server: Apache
 - Version Control: Git/GitHub
- The system is expected to run on a moderate-performance hosting server.
- UI will be designed to be functional but simple, with minimal animations or advanced visuals.

Limitations:

- Designed for a single caretaker company with a fixed set of services.
- Web-based system accessible through standard browsers.
- The system will support four user roles: Admin, HR Manager, Caretaker, Client.
- Intended for internal and client-side use; not designed for public marketplace listing

4. Proposed System's Architecture

4.1 System Overview:

- **Centralized Database:** All user, service, and transaction data stored securely in one MySQL database.
- **Role-Based Access Control:** Each user type has specific permissions and functions.
- **Automated Workflows:** Service booking, leave approvals, and caretaker assignments are automated to reduce manual effort.
- **Secure Operations:** Password encryption, session management, and input validation protect user data.
- **Scalability:** The system architecture allows adding new modules (like payroll or mobile app support) without major structural changes.
- **Cross-Platform Accessibility:** Can be accessed through any device with a browser and internet connection.

4.2 Components and their functionalities:

The system follows an MVC (Model-View-Controller) pattern for separation of concerns.

- **Model:** Interacts with the database (e.g., user data, schedules, feedback). Uses MySQL for storage.
- **View:** Front-end interface (HTML/CSS/JS) for users to interact (dashboards, forms).
- **Controller:** Handles logic (PHP) for processing requests, authentication, and returning views.

Key Components:

- Authentication: Secure login, role-based sessions, forgot password.
- File Management: Upload profiles, feedback files.
- Routing: Maps URLs to controllers (e.g., /apply-leave to LeaveController).
- Error Handling/Logging: Tracks failures for recovery.

4.3 Component interactions

1. User interacts with View (frontend).
2. The Controller receives input and processes logic.
3. Model retrieves/updates database records.
4. Controller returns the updated View to the user.

Security layers include input sanitization, prepared statements, and CSRF protection.

6. Current Progress

6.1. System development progress concerning the system requirements

Completed Features:

- Fully completed and navigable User Interface
- Working Login & Sign-Up module with authentication and validation
- Completed 4 CRUD operations
 - Caretaker Management CRUD
 - User Management CRUD
 - Complaint Management CRUD
 - Leave Management CRUD
- Database Development
 - A preliminary database structure was created, and necessary tables have been designed to store user and system data.

6.2. Progress Chart

6.3. Remaining Tasks

- **Database Finalization:**
 - Complete the design and optimization of the database to include all remaining fields and relationships
- **User Functionalities:**
 - Develop and integrate the remaining user-specific features
 - Functionality of Admin
 - Functionality of HR Manager
 - Functionality of Caretaker
 - Functionality of Client

6.4. Member Contribution

	Current Individual Contribution	Current Common Contribution	Individual Future Work Distribution	Common Future Work Distribution
Thanushya	Admin UI and Caretaker Management CRUD Login & Sign-Up module authentication	Database Development Fully completed and navigable User Interface	Complete Admin Functionalities	Database Finalization System Testing
Satheeshan	HR Manager UI and Complaint Management CRUD		Complete HR Manager Functionalities	
Piyula	Caretaker UI and User Management CRUD		Complete Caretaker Functionalities
